PRODUCT: WATER FILTRATION MEDIA

We supply different kinds of Filtration Media: Activated carbon, activated carbon foam, natural zeolite, LFB Biopellet and filter material HDPE.

Activated Carbon in granules, cylinders or foam is a filtration media capable of retaining macromolecules, colorants and colloids, acting as universal adsorbent. Powerful filtration material for the elimination of proteins, dyes, odours and other pollutants, both in liquid and gaseous media. Especially indicated in the removal of non-polar and high molecular volume substances (hydrocarbons, phenols, polypeptides, etc.).

Natural Zeolite is a powerful filtration media for fluid beds, sand filters, filter and percolation bags.

Biopellet LFB helps the initial growth of aerobic nitrifying bacteria to different salinities and temperatures that eliminate ammonia, nitrites and nitrogen compounds from water and also contribute to the elimination of phosphates from the culture medium. In a second phase the LFB biopellet promotes the establishment of an anaerobic layer in which denitrifying bacteria are established, which eliminate nitrates with great effectiveness and corrects the acidification resulting from nitrification.

PEHD Filtering material specially designed for use in aquaculture and water treatment. This filtering material is applied in percolation filters and moving bed filters. It has a wide contact surface that facilitates the growth of nitrifying flora and the balance of gases, avoiding problems of supersaturation.

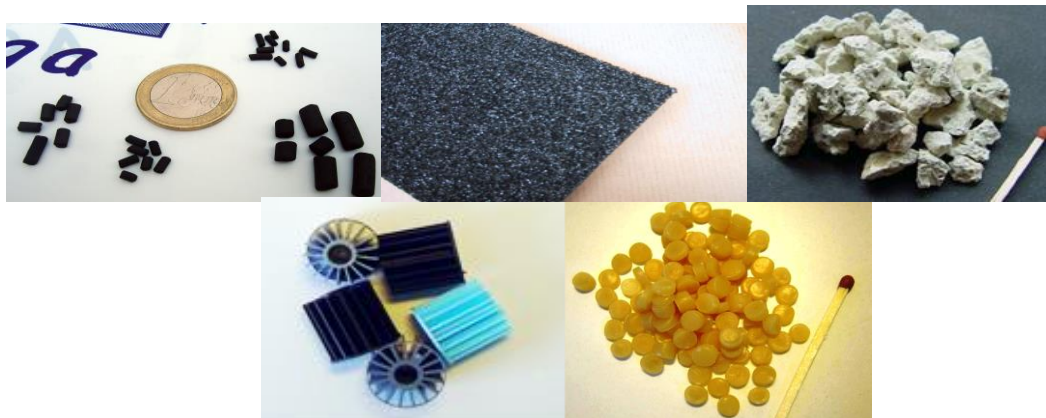

10% DISCOUNT FROM REGULAR PRICE

OFFER DATE AND VALIDITY: July 6 th, 2017/ 30 days.

DELIVERY TIME: 7 working days from date of order.

PAYMENT: To be convened.

ADDITIONAL INFORMATION: Quotation excludes delivery and VAT charges. Please contact our commercial address at ventas@acuinuga.com for further details.
